Key Concepts Covered in Lesson 12.1

Types of Angles and Their Properties

Understanding the basic types of angles is fundamental. Here are the primary types discussed:

- Complementary Angles:** Two angles whose measures add up to 90° . Example: If angle A measures 40° , then angle B, complementary to A, measures 50° .
- Supplementary Angles:** Two angles whose measures add up to 180° . Example: If angle C measures 110° , then angle D, supplementary to C, measures 70° .
- Vertical Angles:** When two lines intersect, the opposite (vertical) angles are equal. Note: Vertical angles are always congruent.
- Adjacent Angles:** Angles that share a common side and a common vertex.
- Special Types:**
 - Linear Pairs:** Adjacent angles that are supplementary (sum to 180°).
 - Complementary Adjacent Angles:** Adjacent angles that are complementary (sum to 90°).

Angle Pair Relationships

In Lesson 12.1, special attention is given to identifying and proving relationships between angles:

- Vertical angles are equal and often used to find unknown angles when two lines intersect.
- Linear pairs are supplementary, and this property is useful in solving for missing angles.
- Corresponding angles and alternate interior angles are equal when lines are parallel.

Using Algebra to Find Angle Measures

Students are introduced to algebraic techniques to determine unknown angles:

- Assign variables to unknown angles.
- Use relationships like supplementary or complementary to set up equations.

Solution: Carefully translate the relationships into algebraic equations. Double-check that the relationships (e.g., supplementary, complementary) are correctly applied before solving.

Practice Problems to

Reinforce Learning

Problem 1: Find the Unknown Angle in an Intersection Two lines intersect, forming four angles. One of the angles measures 65° . What are the measures of the other three angles?

Solution Approach: Vertical angles are equal to 65° . The linear pair (adjacent to the 65° angle) sums to 180° , so find its measure. Use these to find the remaining angles.

Problem 2: Prove that Two Angles are Supplementary Given a diagram where a transversal crosses two parallel lines, angle A and angle B are alternate interior angles. Prove that angles A and B are supplementary if they are adjacent.

Hint: Use the properties of parallel lines and transversals.

Problem 3: Algebraic Angles In a triangle, one angle measures (x) degrees, another measures $(2x)$ degrees, and the third measures 80 degrees. Find the value of (x) .

Solution: Set up the equation: $(x + 2x + 80 = 180)$. Solve for (x) .
