Sample Questions from the November 2013 Examination and Their Solutions

Understanding the types of questions asked and reviewing their solutions is crucial. Below are examples of typical questions from the November 2013 memorandum, along with explanations.

Question 1: Explain the concept of price elasticity of demand and how it impacts business pricing strategies.

Answer: The price elasticity of demand measures how sensitive the quantity demanded of a good is to changes in its price. It is calculated as the percentage change in quantity demanded divided by the percentage change in price. If demand is elastic (elasticity > 1), a small price change leads to a significant change in quantity demanded, prompting businesses to be cautious with price increases. Conversely, if demand is inelastic (elasticity < 1), firms can increase prices without losing much in sales, often to maximize revenue. Understanding elasticity helps businesses set optimal prices and forecast sales responses to price adjustments.

Question 2: Using the data below, calculate the price elasticity of demand:

Price (R)	Quantity Demanded
R10	100 units
R12	80 units

|Solution: First, calculate the percentage change in price and quantity demanded:

Percentage change in price = $\frac{12 - 10}{10} \times 100 = 20\%$

Percentage change in quantity demanded = $\frac{80 - 100}{100} \times 100 = -20\%$

Price elasticity of demand = $\frac{-20\%}{20\%} = -1$

in price = $[(12 - 10) / 10] \times 100 = 20\%$ Percentage change in quantity demanded = $[(80 - 100) / 100] \times 100 = -20\%$ Now, elasticity = $(\% \text{ change in quantity demanded}) / (\% \text{ change in price}) = -20\% / 20\% = -1$ The absolute value is 1, indicating unit elastic demand at this price point.
