Root Finding Methods in Detail

Bisection Method A simple and robust method to find roots of continuous functions.

Procedure: Choose two points a and b such that $f(a)$ and $f(b)$ have opposite signs. Compute the midpoint $c = (a + b)/2$. Evaluate $f(c)$. Replace either a or b with c based on the sign of $f(c)$. Repeat until the desired accuracy is achieved.

Advantages: Guaranteed convergence Simple to implement

Limitations: Slower convergence compared to other methods

Newton-Raphson Method An efficient iterative method that uses the derivative.

Formula: $x_{n+1} = x_n - f(x_n)/f'(x_n)$

Procedure: Make an initial guess x_0 . Compute successive approximations using the formula. Continue until the difference between successive approximations is below a threshold.

Advantages: Fast convergence near the root

Limitations: Requires derivative calculation May diverge if initial guess is far from the root

Numerical Differentiation and Integration Techniques

Finite Difference Method Approximates derivatives using function values at specific points.

Forward Difference: $f'(x) \approx [f(x + h) - f(x)] / h$

Backward Difference: $f'(x) \approx [f(x) - f(x - h)] / h$

Centered Difference: $f'(x) \approx [f(x + h) - f(x - h)] / (2h)$

(2h) Numerical Integration Approximate the definite integral of a function over an interval. Trapezoidal Rule: $\int_a^b f(x) dx \approx (h/2) [f(a) + 2 \sum_{i=1}^{n-1} f(x_i) + f(b)]$ Simpson's Rule: $\int_a^b f(x) dx \approx (h/3) [f(a) + 4 \sum_{\text{odd } i} f(x_i) + 2 \sum_{\text{even } i} f(x_i) + f(b)]$ Gaussian Quadrature: Uses weighted sums of function values at specific points (nodes) for higher accuracy. Solution of Linear Equations Gauss Elimination Method Transform the system into an upper triangular form and solve via back-substitution. Steps: Forward elimination to zero out below-diagonal elements. Backward substitution to find solutions. Gauss-Jordan Method Extends Gauss elimination to reduce the matrix to reduced row-echelon form, directly giving solutions. Iterative Methods Useful for large systems. Jacobi Method Gauss-Seidel Method Numerical Solutions of Differential Equations Euler's Method Simple explicit method for solving first-order differential equations. Formula: $y_{n+1} = y_n + h f(x_n, y_n)$ Runge-Kutta Methods More accurate methods, especially the Fourth-Order Runge-Kutta (RK4). RK4 Algorithm: Calculate four slopes (k_1, k_2, k_3, k_4) and combine them for the next value.
