It is especially useful when prior distributions are known or can be modeled effectively. Applications include: Image deblurring Speech enhancement Compressed sensing The Bayesian approach embodied in MAP estimation provides a flexible framework for balancing observed data with prior expectations. Detection Theory: Recognizing Signals in the Presence of Noise Detection involves deciding whether a signal of interest is present in the data. The volume elaborates on the Neyman-Pearson criterion, which maximizes detection probability for a fixed false alarm rate, leading to the development of likelihood ratio tests (LRT).
