Sample Solutions and Walkthroughs for Easley and Kleinberg Exercises

Example 1: Maximum Flow Problem

Suppose you are given a directed network with capacities and asked to find the maximum flow from source s to sink t . Model the network as a graph with nodes and directed edges with capacity values. Initialize flow to zero on all edges. Use the Ford-Fulkerson algorithm:

- Find an augmenting path using BFS or DFS.
- Update capacities along the path.
- Repeat until no augmenting paths remain.

The sum of flows into t is the maximum flow.

Example 2: Shortest Path Calculation

Given a weighted network, find the shortest path from node A to node

B. Choose the appropriate algorithm (Dijkstra's for non-negative weights). Initialize distances, setting the start node A to zero and others to infinity. Use a priority queue to select the next node with the smallest tentative distance. Update neighboring node distances if a shorter path is found. Continue until reaching node B or exploring all nodes. Trace back the path from B to A to identify the shortest route.

Example 3: Network Connectivity and Critical Nodes Identify nodes whose removal disconnects the network. Calculate the network's connectivity using algorithms like Tarjan's for articulation points. Remove identified critical nodes and observe the impact on network connectivity. Assess network resilience by simulating failures and measuring the size of the largest connected component.
