Preprocessing involves cleaning data to remove errors, adjusting for stock splits, dividends, and other corporate actions,

and normalizing data for comparability.

Statistical Measures and Metrics

The methodology employs various statistical tools, including:

- Descriptive statistics:** mean, median, variance, standard deviation.
- Correlation coefficients:** to assess relationships between assets.
- Autocorrelation and partial autocorrelation:** to identify dependencies over time.
- Moving averages:** simple, exponential, and weighted.
- Volatility measures:** historical volatility, implied volatility, and GARCH models.
- Return distributions:** skewness, kurtosis, and tail risk analysis.

These metrics help characterize asset behaviors and market dynamics quantitatively.

Modeling Techniques

Modeling is central to the analysis, often involving:

- Time series models:** ARIMA, GARCH, and stochastic processes.
- Regression analysis:** to identify factors influencing asset prices.
- Factor models:** such as the Fama-French three-factor model.
- Machine learning algorithms:** for pattern recognition and predictive analytics.
